MEDIA RELEASE

May 1, 2026

The most recent version of the Preliminary Engineering Report for the Lebanon Wastewater Treatment Plant Improvements that includes discussion of the potential Treated Water Effluent Line to the Upper White River Watershed depicts an effluent discharge (potential Outfall 002), cascade aeration system, and UV re-disinfection structure within the limits of Eagle Creek Park. At this time, the potential Outfall 002 location is under review to locations within the Upper White River Watershed that are outside of Eagle Creek Park. As Lebanon Utilities has noted for some time now, the location indicated in the Preliminary Engineering Report is not being considered as the final discharge location but was included in that report to obtain the most stringent permitting limits for design. The options for the final discharge location for the Treated Water Effluent Line are still being evaluated and have not been finalized, but the discharge location will not occur within the limits of Eagle Creek Park.
